Key Outcomes & Analysis

Success: Core Feature Development & Project Structure Implementation

The team has successfully implemented several foundational and core feature components necessary for a task management application, as evidenced by the completed tasks in the kanban board:

- **Input Component Development:** The text input field (#new-task-input) was created, establishing the mechanism for users to add new tasks.
- **List Display Implementation:** The necessary display element (with ID #task-list) was created to structure and present the tasks to the user.
- **Input Component Extension:** An additional component/feature related to input was created: the column done, likely for marking tasks as completed or finished.

Development Progress: Styling, Responsiveness, and Data Persistence

The project has foundational elements in place for styling and data handling:

- **Base Styling:** The initial color scheme and typography were applied.
- **Base Responsiveness:** The team ensured the layout is functional on smaller screens.
- **Data Persistence (Simple):** Saving data to Local Storage was implemented, ensuring tasks are retained between user sessions.

In summary:

Development Progress: Data Persistence (Simple) was implemented, saving data to Local Storage. Base Responsiveness and Base Styling were applied. Core UI components, the Input Component (#new-task-input) and List Display (#task-list), were created, along with the Input Component extension for the column done.

My To-Do List Final Project

WDD 430: Web Full-Stack Development
